

ABSTRACT OF THE DISCLOSURE

An image forming apparatus includes a body frame having left and right side frame parts and a partition wall frame part that is placed below a sheet path passing
5 through an image forming unit in a process unit. The process unit and a drive transmission system frame having a drive mechanism for transporting sheets are placed in a longitudinal direction on an outer face of the left side frame part. A high voltage power board, a low voltage power
10 board, and an engine control board for the drive mechanism are fixedly placed horizontally on a lower face side of the partition wall frame part. A main control board is placed substantially vertically so as to become adjacent to the drive transmission system frame and extend along the outer
15 face of the left side frame part. The boards and parts are connected by connection lines.
